VMT Contaminated Soils Landfarming

Onsite treatment of hydrocarbons is more sustainable than hauling away contaminated soil for thermal remediation. Alyeska's Environment Team observed that material often wasn't overly contaminated, suggesting precipitation and sunlight naturally break down hydrocarbons.

With regulatory permissions and existing equipment to spread and aerate the soil, onsite treatment of "landfarming" was implemented in 2022 at the VMT. Similar work will continue at the VMT, and landfarming will eliminate the risks and carbon footprint of off-site trucking.
